

# An IPv6 Update

Gooff Huston APNIC Labs

research@apricnet

# Measuring the Internet

- APNIC Labs operates a very large network measurement system
- The measurement is based on a scripted online advertisement
- The Ad script instructs the browser to retrieve a small set of URLs:
  - Each URL retrieval requires the resolution of a DNS name and fetch a small web object
  - We construct the DNS names to be unique (to eliminate caching) and steer the DNS and Web requests to our servers
  - We can infer the properties of the end host platform by looking at the DNS and web behaviours

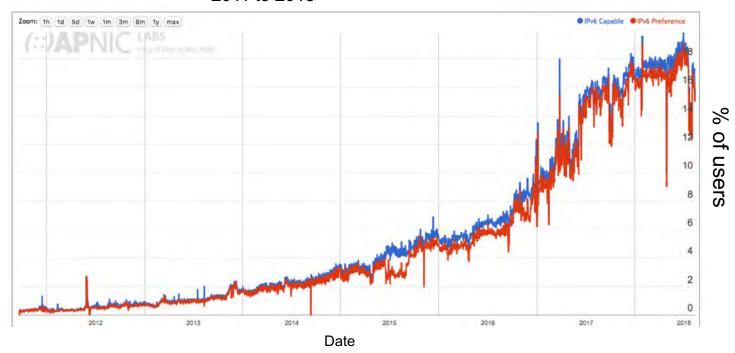

## Measuring the Internet

- The Ad runs at some 7M 10M measurements per day
- The advertisement platform tries to present the ad to new end systems all the time
- We use a set of Ad parameters to try and achieve a uniform presentation rate across the Internet
  - There is a skew to over-present the Ad in some economies we weight the results per-economy to represent an ideal uniform random sample set to compensate for this skew so that we reflect "all of the Internet" results
- This tracks the "eyeball" Internet on both wired and mobile platforms

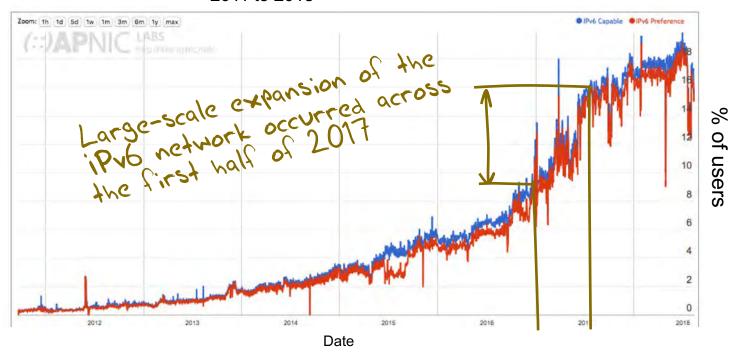

# Measuring IPv6 Deployment

- This is a web-based measurement:
  - "IPv6-Capable" means that the user can retrieve an IPv6-only web object
  - "IPv6-Preferred" means that the user used IPv6 to retrieve a dual stack web object
- We are interested in the longer term picture of both measurements

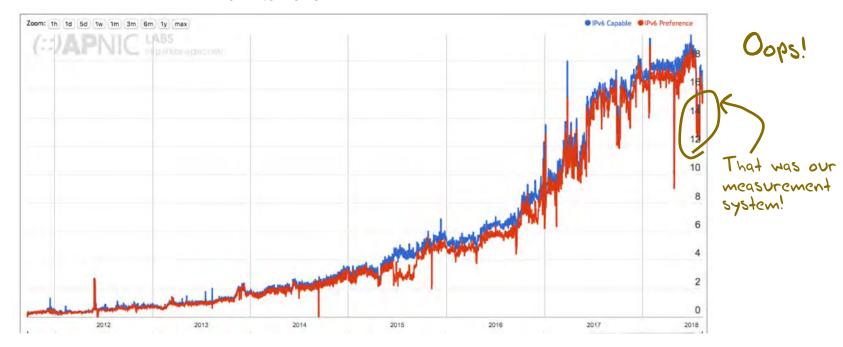

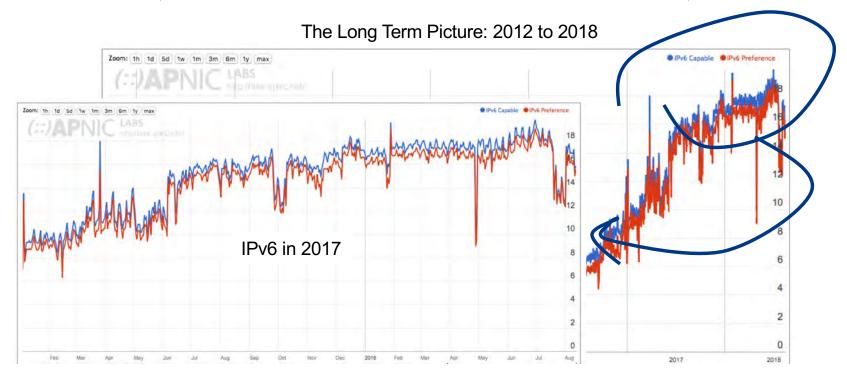

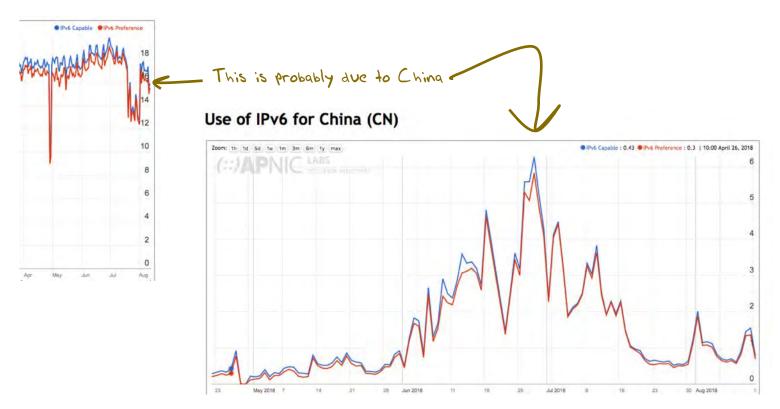

2012 to 2018

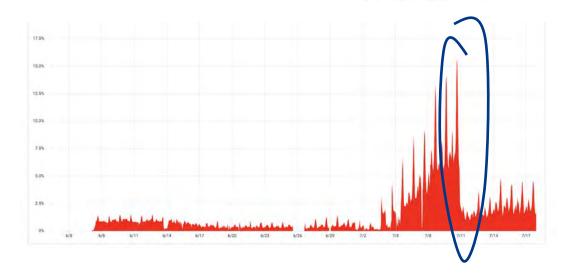

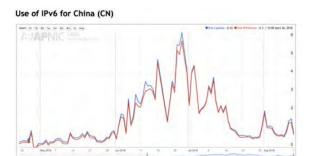

Cloudflare saw it too:

#### IPv6 in China

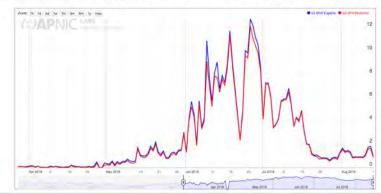

19 Jul 2018 by Tom Paseka.

My guess is that ChinaNet Backbone (AS4134) performed a rapid enabling of iPv6 in June and early July and then backed out of this in mid July.

IPv6 Per-Country Deployment for AS4134: CHINANET-BACKBONE No.31,

### 2017

#### The most recent 20 months – Jan 2017 to August 2018

#### What the?

The pace of adoption of IPv6 in the Internet appears to have slowed down over the past 12 months

Why?

#### Why has IPv6 Deployment Growth slowed?

 One explanation is the factors that are driving IPv6 deployment are no longer as effective as they were

What factors have driven IPv6 growth to date?

 Lets look at the IPv6 network and see what we can establish as common factors behind IPv6 deployment

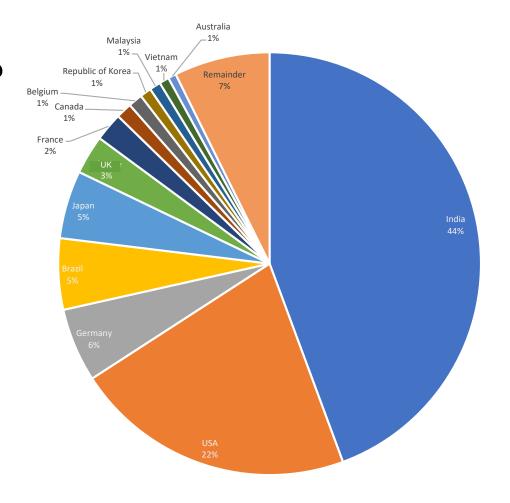

This is the distribution of IPv6 users across the 13 economies with the largest IPv6 using populations.

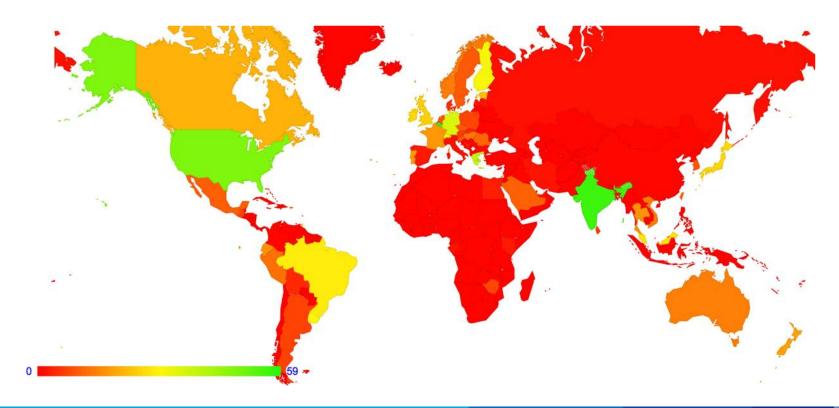

Can you guess which economy has the largest IPv6 user population?

	24214	4.404
India	242M	44%
USA	117M	21%
Germany	30M	6%
Brazil	30M	6%
Japan	28M	5%
UK	17M	3%
France	12M	2%
Canada	7M	1%
Belgium	6M	1%
Malaysia	5M	1%
Rep. of Korea	5M	1%
Vietnam	4M	1%
Australia	3M	1%

The percentages in this table reflect the percentage of the total IPv6 user population who have been geolocated into a particular economy

V-P-ET	The state of the s	ade con St. a
CC	Country	IPv6 Capable
BE	Belgium, Western Europe, Europe	58.76%
IN	India, Southern Asia, Asia	55.78%
US	United States of America, Northern America, Americas	46.73%
GR	Greece, Southern Europe, Europe	37.37%
DE	Germany, Western Europe, Europe	34.48%
FI	Finland, Northern Europe, Europe	30.40%
UY	Uruguay, South America, Americas	30.35%
BR	Brazil, South America, Americas	28.25%
CH	Switzerland, Western Europe, Europe	28.16%
MY	Malaysia, South-Eastern Asia, Asia	27.37%
IE	Ireland, Northern Europe, Europe	26.32%
JP	Japan, Eastern Asia, Asia	25.88%
GB	United Kingdom of Great Britain and Northern Ireland, Northern Europe, Europe	25.12%

#### IPv6 Deployment Drivers

- IPv6 was developed to provide a solution for the projected exhaustion of the free pool of IPv4 addresses
- We've exhausted that IPv4 address pool, yet IPv6 is deployed across less than 20% of the Internet
- Whatever motivated new deployment of IPv6 has not been strongly in evidence in recent months

- Do we even know common motivations for an ISP to deploy IPv6 across its infrastructure?
- Let's look at some common theories and see if the numbers support the theory

# Theories of IPv6 Deployment

You need to be a rich ISP to afford IPv6 deployment

# Theories of IPv6 Deployment

You need to be a rich ISP to afford IPv6 deployment

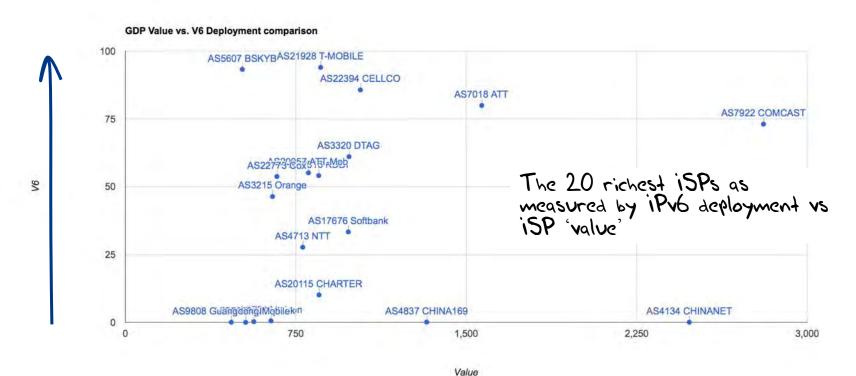

- Let's measure the "wealth" of an ISP by the aggregate wealth of its customer base
  - Wealth of the customer base can be measured using GDP per capita
  - Aggregate wealth of an ISP's customer base is GDP per capita times the ISP's estimated customer population

#### "Rich" ISPs with IPv6 Deployments

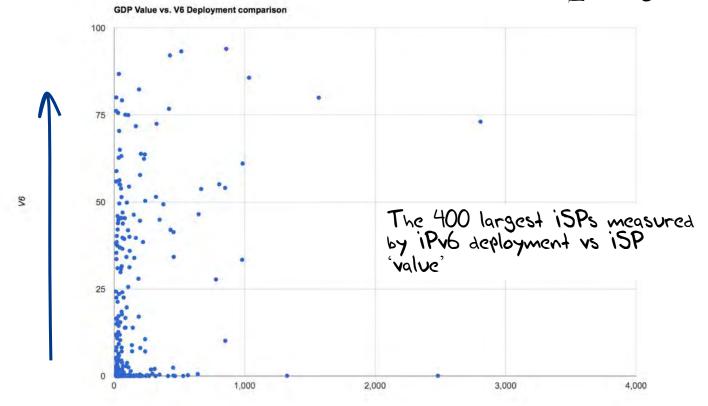

- Rank ISPs by GDP per Capita x Est. Number of Customers
- 12 of the "richest' 20 ISPs have IPv6 deployments of 33% or more across their customer bases

Rank	ASN	AS Name	CC	Users (est.)	Value (GDP x Users)	V6 Users (est)	% of AS

### "Rich" ISPs with IPv6 Deployments

#### "Rich" ISPs with IPv6 Deployments

# IPv6 is not exclusively deployed by big ISPs in rich countries

- 73% of IPv6 users are serviced by ISPs outside the 'richest' top 20
- Major ISPs with IPv6 deployments with "richness" rank > 20:
  - Reliance JIO India (40%. Rank: 25)
  - Vodaphone India (3%, Rank: 111)
  - ICLnet India (2.5%, Rank: 129)
  - Claro, Brazil (1.7%, Rank: 53)
  - Kabel Deutschland, Germany (1%, Rank: 31)
  - SK Telecom, Korea (1%, Rank: 56)
  - Sprint, US (1%, Rank: 27)
  - Telefonica Brazil (1%, Rank: 109)

Rank order of value of customer base

Percent of the World's iPv6 User pool

# You don't need to sell services to rich customers to deploy IPv6

But it helps!

- Outside of China, the correlation of the aggregate wealth of the an ISP's customer base to IPv6 deployment is pretty high
- But it's not the entire story...

# Theories of IPv6 Deployment

- You need to be a rich ISP to afford IPv6 deployment
- You need to be growing quickly to be forced into IPv6 deployment

# Rapidly Growing ISPs

- ISPs with high growth in their customer base are now under high IPv4 address stress
- Does this growth-related stress alter their perceptions of the risk / benefits of IPv6 adoption and spur IPv6 deployment?

# Rapid Growing ISPs

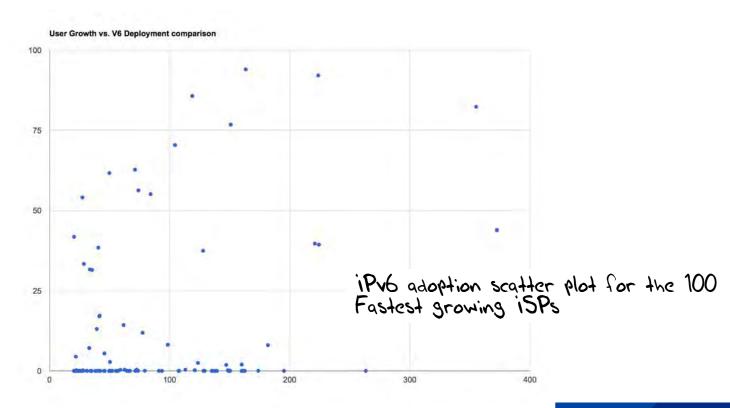

Aggregate growth of the estimated customer base in the past 16 months

# Rapidly Growing ISPs

- 100 ISPs with more than 1M estimated customers grew their customer base by more than 20% over the past 16 months
- Only 26 of these ISPs had a IPv6 deployment above 10% of their user base

# Rapidly Growing ISPs

9/

# It's probably not Rapid Growth

- It appears that at present most rapidly growing ISPs (93%) are using IPv4 addressing to sustain their rapid growth and are not making accelerated investments in IPv6-capable infrastructure
- In other words, rapid growth of an ISP's customer base does not necessarily motivate an accelerated IPv6 deployment

# Theories of IPv6 Deployment

- You need to be a rich ISP to afford IPv6 deployment
- You need to be growing quickly to be forced into IPv6 deployment
- You are running very short of IPv4 addresses

## Calculating Customers per IPv4 Address for each ISP

- Use the estimate of the customer population per ISP
- Analysis of the BGP routing table can give us the number of advertised IPv4 addresses per originating ASN
- We can then correlate the estimated customer population of an ISP with the span of IPv4 addresses originated by the ISP's ASN to give a ratio of customers per advertised IPv4 address

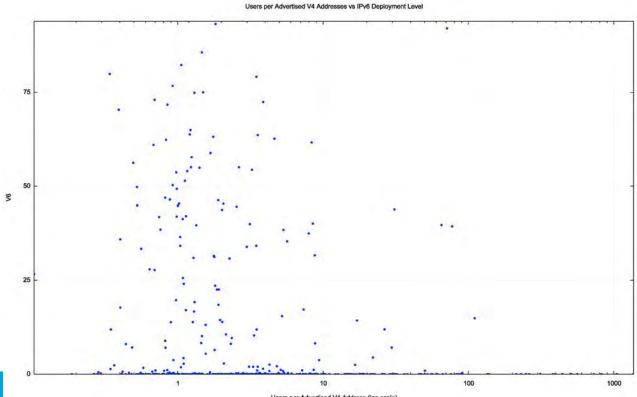

# Customers per IPv4 Address

31 Largest ISPs (measured by estimated customer count)

Rank	AS	AS Name	CC	Customers	V6 Deployment	IPv4 Addrs	Ratio

# Customers per IPv4 Address vs IPv6 Deployment

418 Largest ISPs (measured by estimated customer count)

#### Running Short of IPv4 Addresses

- 418 ISPs have a customer population of over 1M
- 81 of these ISPS are not 'stressed' for IPv4 yet:
  - They have more than 1 IPv4 address per customer
  - 31 of these ISPs have a IPv6 deployment rate greater than 5% (38% of these 'unstressed' ISPs)
- 337 of these ISPs are 'stressed' for IPv4:
  - They have less than 1 IPv4 address per customer
  - 80 of these ISPs have an IPv6 deployment rate greater than 5% (23% of these 'stressed' ISPs)
- Unusually, those ISPs with a higher level of IPv4 address stress have a lower IPv6 deployment rate

#### Running very short of IPv4 Addresses

- 19 ISPs have more than 100 customers per advertised IPv4 address
- Only 1 of these ISPs has an IPv6 deployment rate of more than 5% (and its 'stress rate' is 100 customers per advertised IPv4 address)
  - Actually, only 1 has an IPv6 deployment more than 0.04%
- The other 18 ISPs have higher address 'stress rates' of between 135 to 1,370 customers per advertised IPv4 address and negligible IPv6 deployment levels

It appears that acute IPv4 address overuse is not a major driver for IPv6 deployment

# The Changing Internet

- IPv6 was designed as a solution to a different Internet
- The Client / Server CDN-centric Internet does not require each endpoint to have a globally unique permanent address
- Addresses are increasingly being used in the role of ephemeral session tokens, not as persistent endpoint identifiers

- This does NOT mean that IPv4 will last indefinitely it won't
- But it does mean that many areas of the Internet are yet to experience major pressures to deploy IPv6 in a client/server context

# Theories of IPv6 Deployment

- You need to be a rich ISP to afford IPv6 deployment
- You need to be growing quickly to be forced into IPv6 deployment
- You are running very short of IPv4 addresses
- Local conditions

# National IPv6 Deployments

- Economies where 3 or more of the 6 largest ISPs have IPv6 deployment levels > 20%:
  - India (58%)
  - Belgium (58%)
  - USA (44%)
  - Germany (39%)
  - Greece (38%)
  - Japan (27%)
  - Brazil (26%)

India shows that competitive factors can drive IPv6 deployment across the major ISPs in a country, but this is not clear in all countries with significant IPv6 deployment

#### What Drives Deployment of IPv6?

- There is no major common factor at work here
- IPv6 deployment is not confined
  - to ISPs in countries with higher GDP per capita
  - to ISPs who are growing their user base the fastest
  - to ISPs that are experiencing the highest levels of IPv4 address stress
  - to national communities
- However, all these factors appear to help in individual cases

# Back to our question...

 The pace of adoption of IPv6 in the Internet appears to have slowed down over the past 9 months

What's going on?

# Back to our question...

 The pace of adoption of IPv6 in the Internet appears to have slowed down over the past 12 months

What's going on?

We're not sure!

Thanks!
